1 Introduction

The Currency Spares System (CSS) is an in-house developed application to manage the stocks of spare parts for currency handling machines. The spare parts are purchased using the IFS PAI system and then issued out to the Currency Department. Currently the department maintains stores for spare parts at each currency center and keeps track of the stocks using Microsoft Excel sheets. Each currency center maintains the records in their own Excel sheets and these must be consolidated in order to get a wholistic inventory of the spares across all currency centers. The CSS was developed to improve the process of tracking the stocks of spare parts using a single central database thereby facilitating reporting.

This document is a guide on how to use the CSS.

1.1 Scope of Document

This document shows basic steps on how to navigate and work with the Currency Spares system

1.2 Ownership

This document is the property of Bank of Uganda. It shall not be used, copied, or published in part or in full without proper authorization from the Bank Management.

1.3 Terms and Acronyms

These are terms that you will come across as you use this user guide.

Term	Description

2 Overview of the CSS

The CSS is a client-server application comprised of an SQL Server database and a Microsoft Access client application. The application has the following main functions:

2.1 User Access Control

The CSS manages access to the application through user accounts and roles. To access the CSS, one must have an account and a password. The user account is created by the System Administrator and an initial password is provided. The user, on first login, is prompted to change the password to his/her own secret one.

The System Administrator is also responsible for assigning a user account a particular role. A role is a set of functions that the user is allowed to perform on the CSS. For example, a user account that has been assigned the **System Administrator role** can create user accounts and perform other maintenance tasks on the CSS while an account assigned the **Stock Manager role** is able to create products and new stores.

The CSS authenticates a user by requesting for a username and password at login. The user must then select the role to play on the CSS before being given access. Click here to see details on how to logon to the CSS.

2.2 Products

The CSS was developed to keep an inventory of items hereafter called products. It is therefore logical that to start using the system, products must be defined. Each spare that is maintained in the stores and tracked is a product. A product has a set of attributes that distinguish it from another product. For a spare part to qualify as a distinct product, it must have attributes or characteristics that distinguish it from all other existing parts.

The CSS maintains a single product list for all stores. This is the master item list and must be maintained centrally. The product list does not have the quantities of items at each of the branches. These quantities will be determined through reports as illustrated in the section on reports.

In the CSS a product has the following attributes:

- **Product Code**: is a unique code or part number for the spare. Product codes are unique and cannot be shared between two types of parts.
- **Product Name**: is a short name for the spare part. Product names appear in reports and must therefore be short and concise
- **Description**: is a longer description of the part that can be used to provide more detailed information about the product.
- **Unit**: specifies the unit of measure for the spare part. The unit of measure for most spare parts is a Piece. However, it is possible to get things like oil which is measured in liters.
- **Machine**: is an attribute that specifies the machine on which the part is used. Using this attribute it will be possible to get reports on parts for a specific machine. Click here to learn how to maintain machine categories.

There are other attributes but for simplicity the above attributes are sufficient to define a spare part.

Click here to go to the section describing how to create and maintain products.

2.3 Stores

The CSS has functionality to define the various stores at which spare parts are maintained. All transactions on products happen in a particular store. A user account must be given direct permission to access the store to be able to carry out any transactions on products in that store.

Unlike IFS PAI where items must be assigned to a store before transacting, in the CSS, all products are accessible to be transacted in any of the stores.

See here for details on how to create and maintain a store.

2.4 Employees

The CSS has functionality to define employees and associate them to user accounts. Only employees can have direct access to stores. Therefore, the CSS provides functionality to assign a store to an employee. This is a security feature that ensures that access to stores is restricted.

See here for details on employee maintenance.

2.5 Business Days

Another security feature that the CSS uses is the use of business dates. Store assistants and managers must specify transaction dates when creating transactions. To ease reconciliation and validations, the CSS provides for creating and maintaining business dates. The Store Manager is expected to create and open the business dates on which transactions are expected to happen. Conversely, the Store Manager can also close those business dates that have already been reconciled to prevent new transactions being captured on those dates.

See here for details on maintenance of business days.

2.6 Reports

The CSS has several reports related to stocks of the spare parts. These include:

- Product listing
- Stock Position Reports
- Stock out Reports
- Transaction Reports

Click here to learn how to access and print the reports

2.7 Stock Transactions

The CSS has functionality to maintain the following types of transactions:

1. **Receipts**: used to receive items from the IFS or from suppliers. *Click here to learn how receipts and maintained*
2. **Requests**: used to allow stock managers to request a spare part from another store or head office. *Click here for details.*
3. **Issuances**: used to allow stock managers to issue out parts from a given store. *Click here for details.*
4. **Transfers**: used to allow stock managers to transfer parts from one store to another. *Click here for details.*

3 User Access Control

This section describes the access control features of the CSS.

3.1 Login

To access the functions in the CSS the user must login with a valid username and password.

1. Find the shortcut labeled Currency Spares or CSS on your desktop and double-click it.
2. In the Application Logon window, enter a valid username and password.

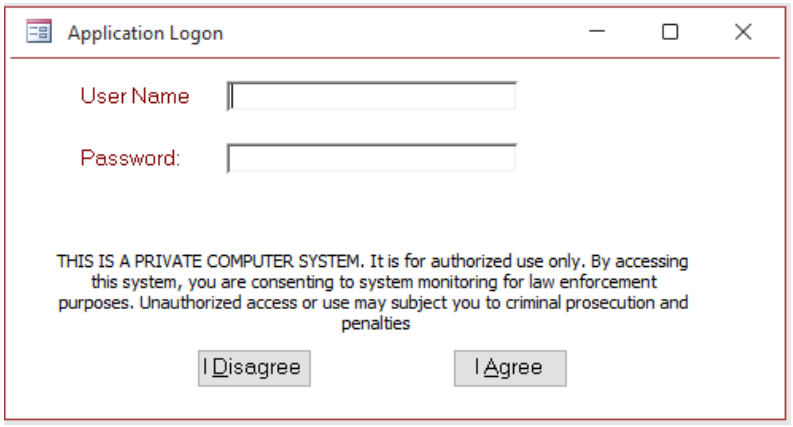

Figure 1: Login screen

3. Read the privacy message and then click I Agree to login.
4. Enter your Username and Password and click **I Agree**.Contactthesystemadministrator(throughIT_Support@bou.or.ug)ifyoudonothavea username and/or password.
5. In the Select Role window, select the role to use for authorization and click Continue

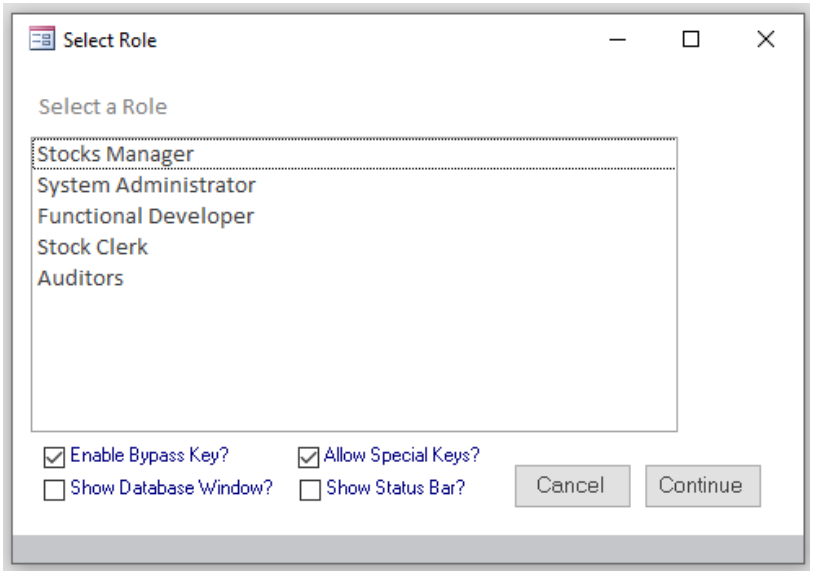

Figure 2: Select Role

6. The Main Switch board below opens.

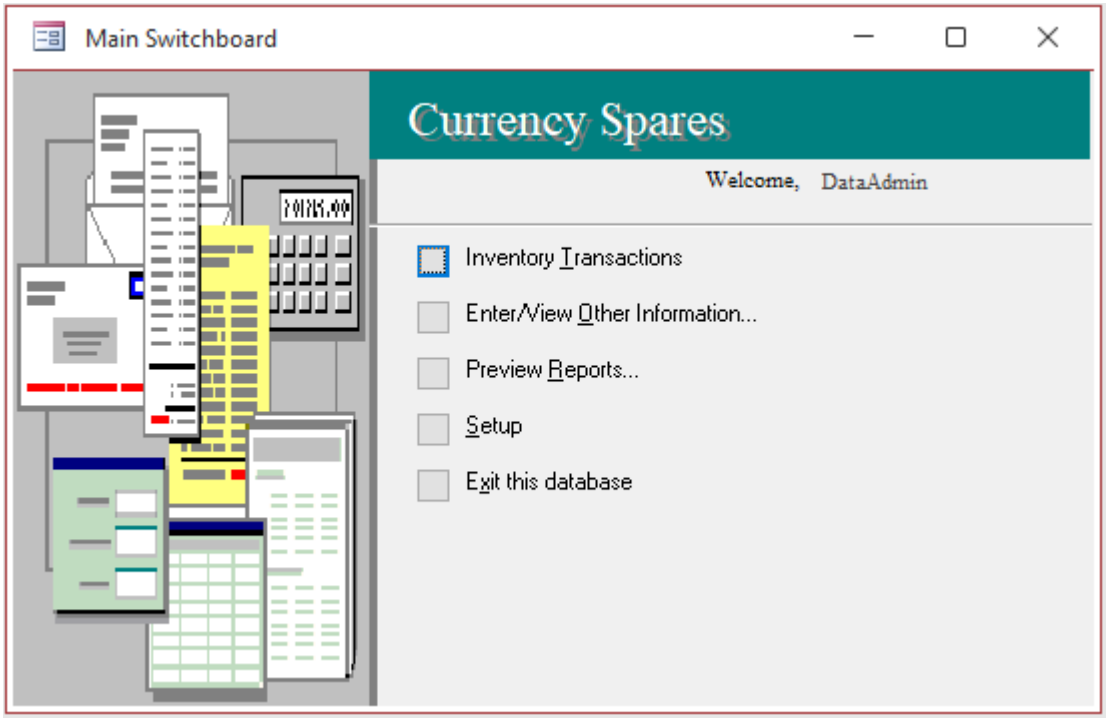

Figure 3: Main Switchboard

3.2 Changing Password

To change the user account password, perform the following steps

1. On the Main Switchboard, click Setup
2. On the next menu, click Change Password
3. Enter old password
4. Enter the new password
5. Confirm new password
6. Click submit.

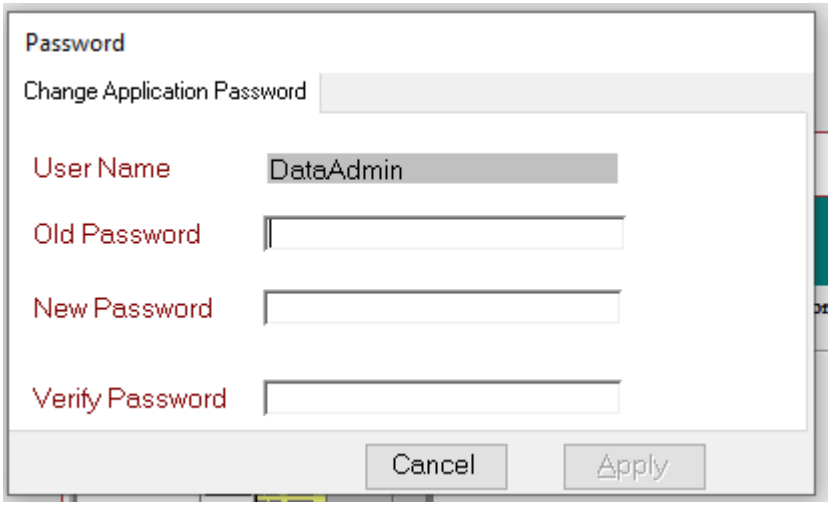

Figure 4: Change Password

4 Product Maintenance

4.1 Creating a Product

A product (spare part) is one of the foundation features in the CSS. To create a product is the same as registering that product in the CSS. Before you can transact in the CSS, the product involved in the transaction must be registered. Below are the steps you can follow to create the product:

1. On the Main Switchboard, click Enter/View Other Information.
2. On the Forms Switchboard, click Enter/View Products. The Products window opens showing the topmost product. See illustration below:

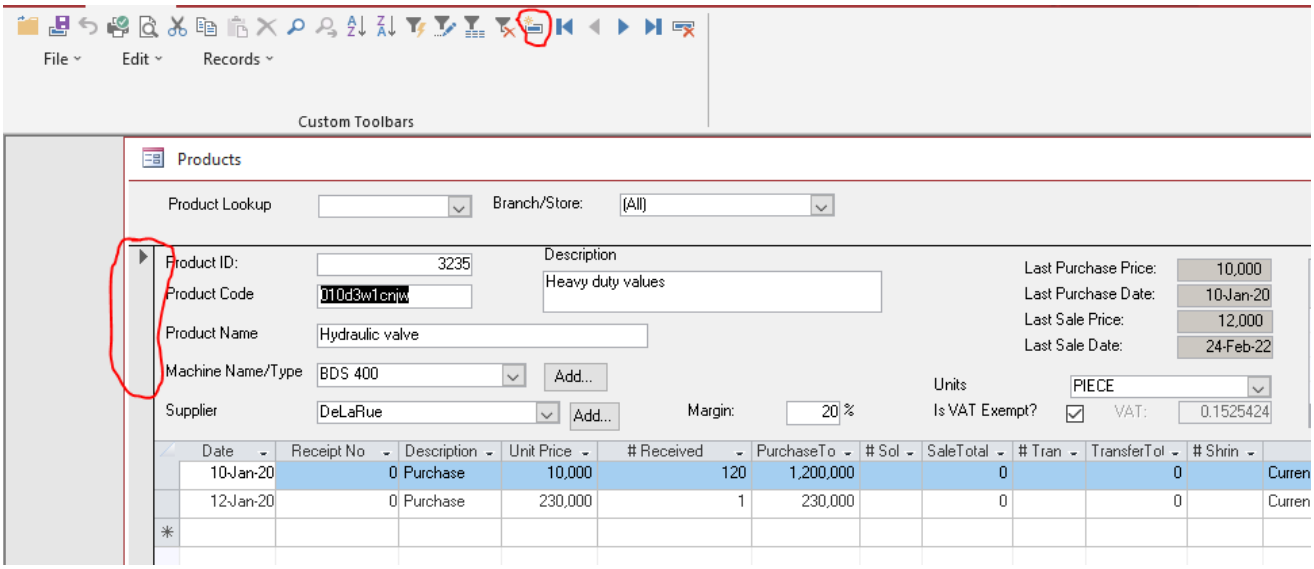

Figure 5: Products Window

3. Click the New Record button circled in red at the top to open a blank page to create a new product.

Note: *Do not overwrite the information on a filled form to create a new product. Always make sure you have a blank form to create a new product. Overwriting an existing product will result in modification of the details of that product.*

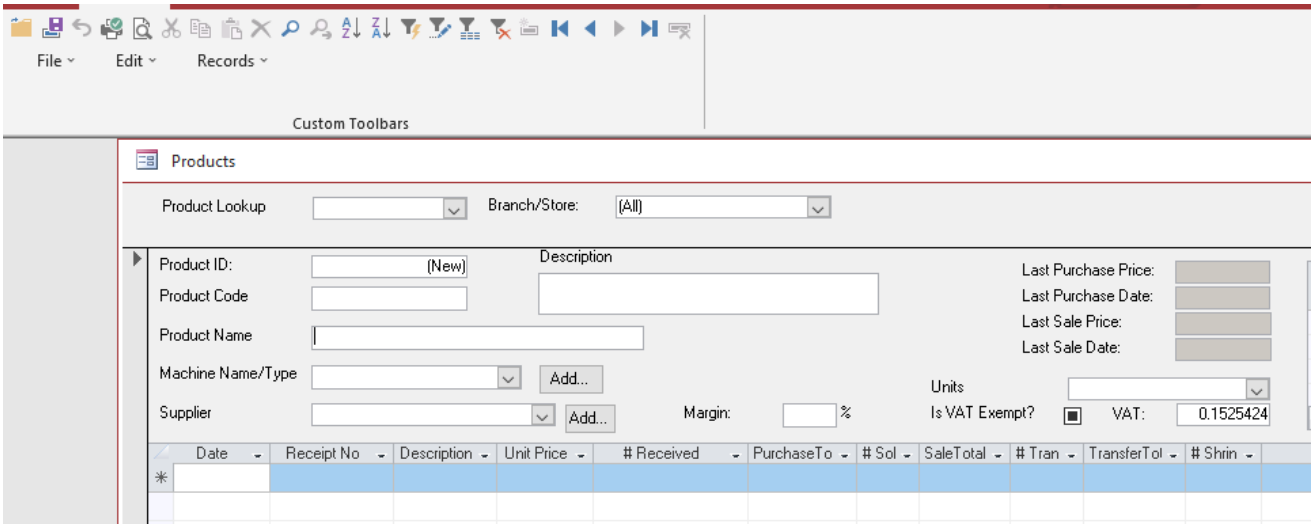

Figure 6: Products (blank form)

4. Enter a unique for product code. This can be a part number or any other identifier for the spare part provided it is unique.
5. Enter a short name for the product. This name should be short because it will be displayed in the reports
6. You can optionally enter a longer description of the product in the Description box. This allows you to enter more detailed description of the spare part
7. Select the machine name or type of the product from the Machine Name/Type dropdown box. If the item does not exist, click the Add button to add it. See Categories
8. Select the Supplier from the Supplier dropdown box.
9. Accept the default unit displayed or change it
10. Click the record selector circled in red on the left to save the record. You can also save the record by simply closing the form.

4.2 Modifying a Product

11. On the Main Switchboard, click Enter/View Other Information and then choose Products from the Forms Switchboard
12. Search for the product that you would like to modify. There are several methods to find the product by the fastest is to use the Product Lookup. Select the product from the lookup. The product record will be fetched and shown in the Product window
13. Make the changes and click the record selector to save

4.3 Deleting a Product

The CSS allows you to delete a product from the database. However, this will only be allowed if there are no transactions on the product. If a product has transactions, then you must first delete those transactions before deleting the product itself.

1. Navigate to the Products window

2. Using the Product Lookup feature, find the product to delete. Make sure it does not have any transactions in the sub-form below the product definition. In the illustration below, there are two transactions in the sub-form and therefore this product cannot be deleted
3. Click the record selector button (shown dark on the left hand side of the illustration)
4. Press the Delete button to delete. Once the deletion is confirmed, you cannot recover the record.

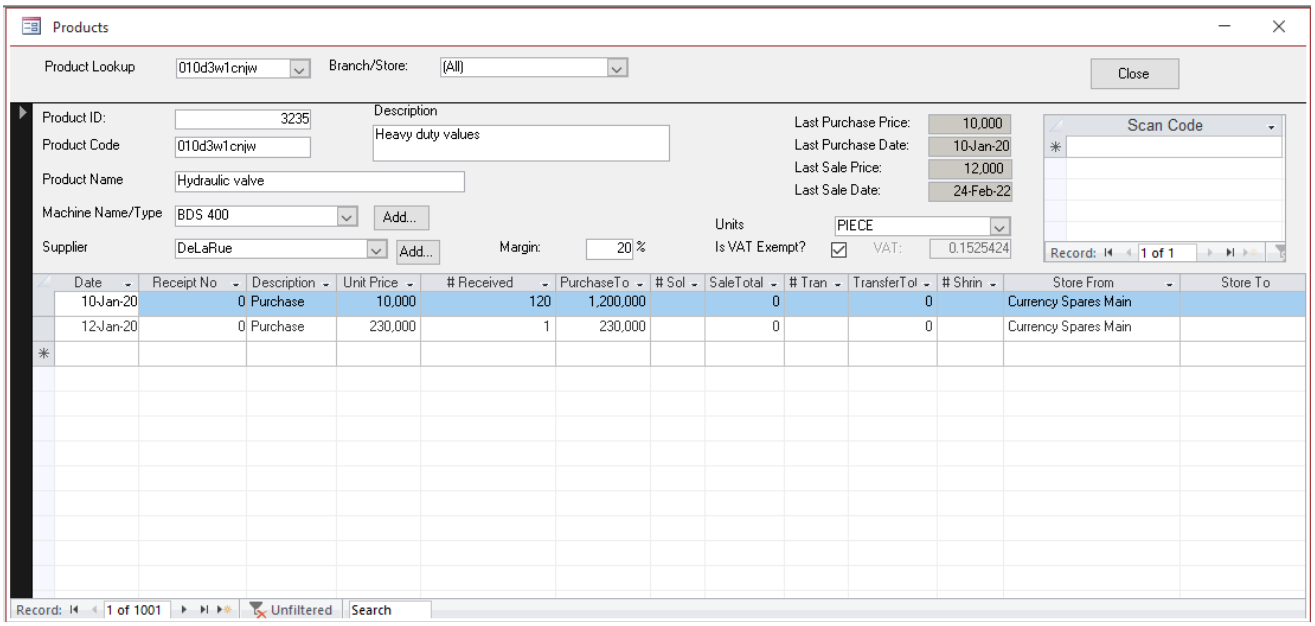

Figure 7: Selected Product

4.4 View Product Transactions

You can quickly view the transactions on a selected product through the sub-form below the product definition. The sub-form (circled in red) displays all transactions made on a particular product.

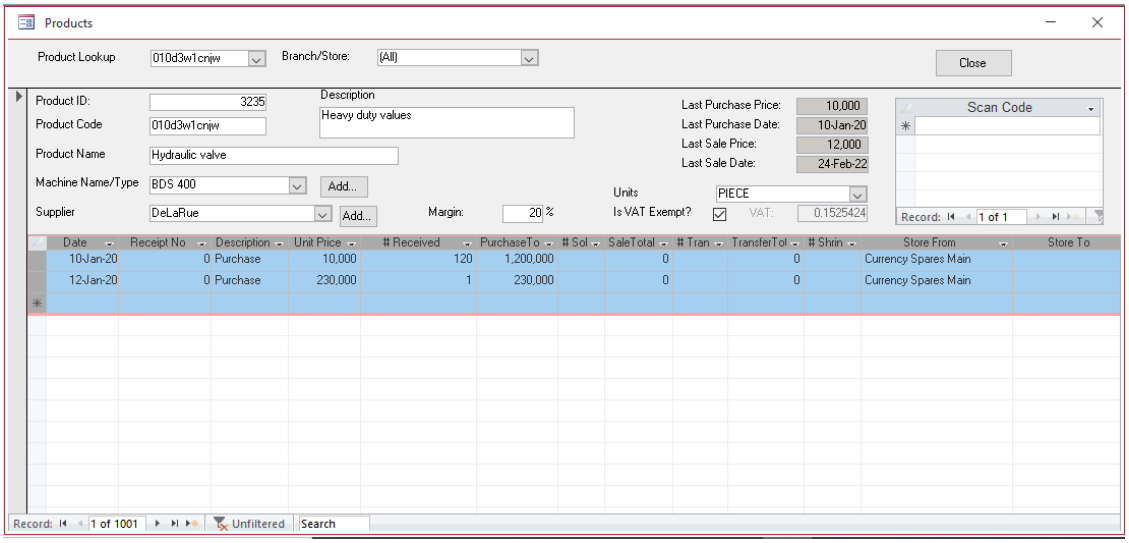

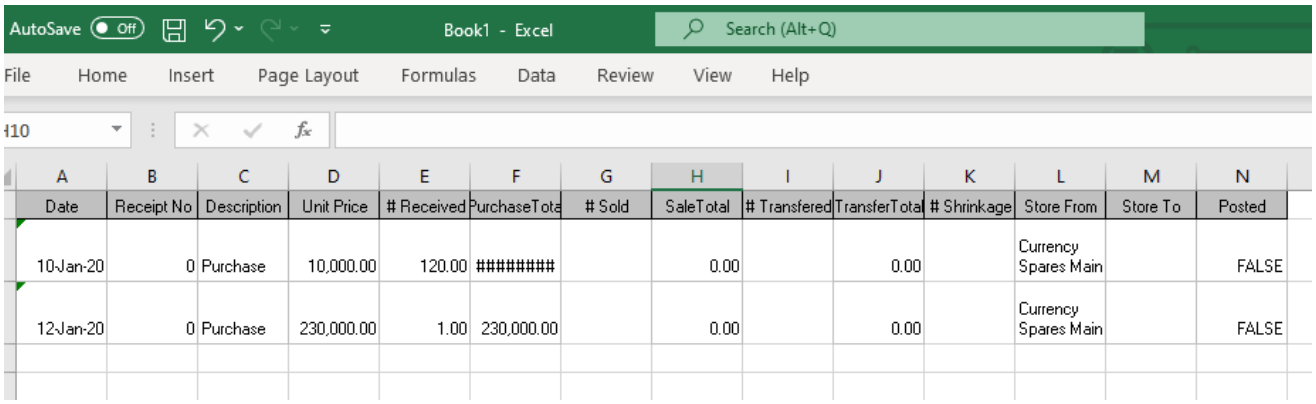

Figure 8: Product Transactions

To copy all the transactions to Microsoft Excel, click the left top corner of the sub-form to highlight the transactions and click Ctrl-C to copy to clipboard. You can then paste the transactions in Excel as shown below:

Date	Receipt No	Description	Unit Price	# Received	PurchaseTota	# Sold	SaleTotal	# Transfered	TransferTotal	# Shrinkage	Store From	Store To	Posted
10-Jan-20	0	Purchase	10,000.00	120.00	#########		0.00		0.00		Currency Spares Main		FALSE
12-Jan-20	0	Purchase	230,000.00	1.00	230,000.00		0.00		0.00		Currency Spares Main		FALSE

Figure 9: Exported Stock Transactions

The CSS allows you to view the product transactions from a selected store. To filter for only one store, select the store from the Branch/Store lookup. In the illustration below, there are no transactions for the selected product at the selected store.

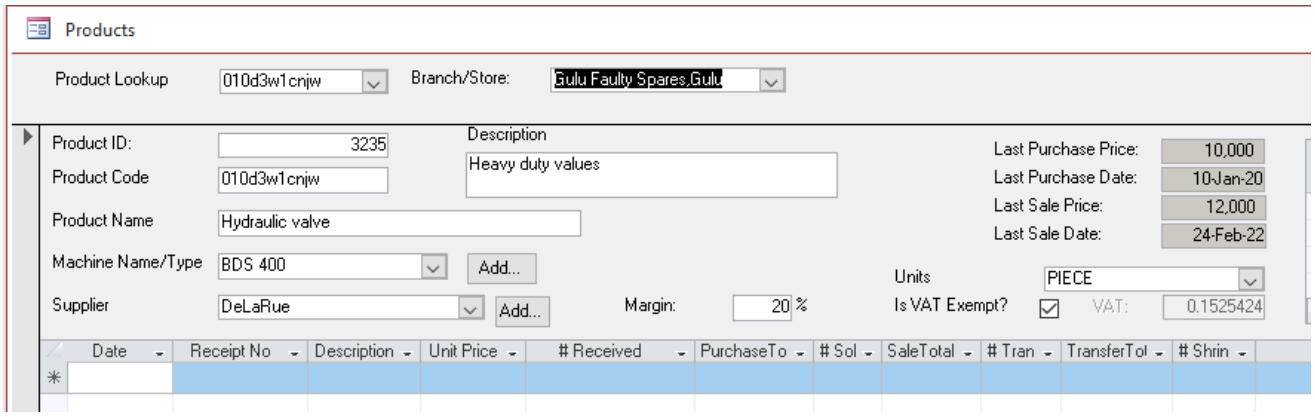

Figure 10: Product Transactions Filtered by Store

5 Stores

In the CSS a store is a logical location where stocks are held and where transactions are carried out. Every transaction in the CSS must happen within a specified store. For example, if items are shipped to a supplier for repair, the CSS requires a store to record such a transaction and there a Supplier's store may have to be created.

5.1 Adding a Store

1. On the Main Switchboard, click Enter/View Other Information.
2. On the Forms Switchboard, click Enter/View Branches/Stores
3. Click the New Record button to get a blank form.
4. Enter a description for the store. This is mandatory
5. Check Allow Purchases, Allow Sales, or Allow Transfers to specify what type of transactions should be allowed at this store
6. You can optionally fill in any of the remaining fields
7. Click the record selector to save the store.

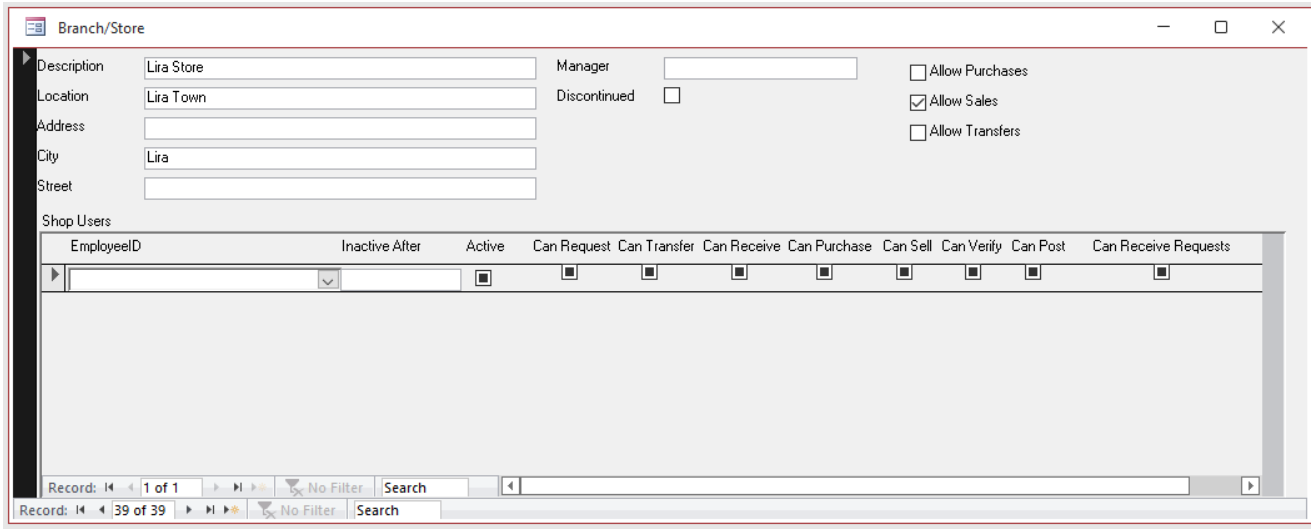

Figure 11: Branch/Store

5.2 Modifying a store

1. Open the Branch/store window
2. Use the record navigation buttons on the window or the menu bar to move from one record to the next until you locate the store you want to modify
3. Make the required changes and click the record selector to save

5.3 Adding Store Users

When a store is created, it cannot be used until at least one employee is assigned to it. Moreover, the assigned employee is the only one that can access the store. Employee assignment allows the CSS to impose some restrictions on the actions that a user can perform on a given store.

To add a store user, the following steps can be used:

1. On the Main Switchboard, click Enter/View Other Information.
2. On the Forms Switchboard, click Enter/View Branches/Stores
3. Use the navigation buttons to move to the store to add an employee.
4. In the sub-form below the store definition, select an employee from the Employee ID dropdown.

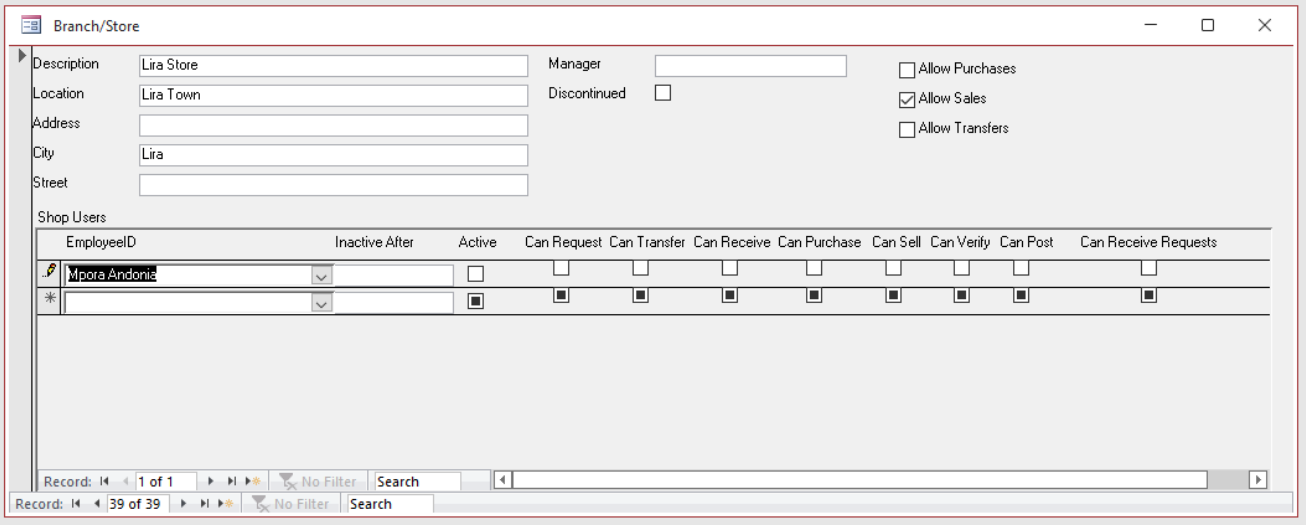

Figure 12: Adding a user to a store

5. Optionally enter the Inactive After date. This enables the CSS to automatically restrict access after the Inactive After date. If this field is left blank, it means access does not expire
6. Check the Active button to activate the assignment
7. Check the other options to determine what operations the employee can do on this store. These include the following:
    a. Can Request: allows the user to make stock requests from this store
    b. Can Transfer: allows the user to transfer items from this store
    c. Can Receive: allows the user to receive items into this store.
    d. Can Purchase: allows the user to create purchase orders on this store
    e. Can Sell: allows the user to issue out items from this store
    f. Can Verify: allows the user to verify a transaction on this store
    g. Can Post: allows the user to post or confirm transactions on this store

h. Can Receive Requests: allows the user to receive requested items into the store

8. Repeat steps (4) to (7) add all other employees

6 Employee Maintenance

The CSS requires an employee to linked to a login username to be registered and assigned rights on a store to perform transactions.

6.1 Adding an employee

Below are steps to create and maintain an employee record:

1. On the Main Switchboard click Enter/View Other Information
2. On the Forms Switchboard click Enter/View Employees

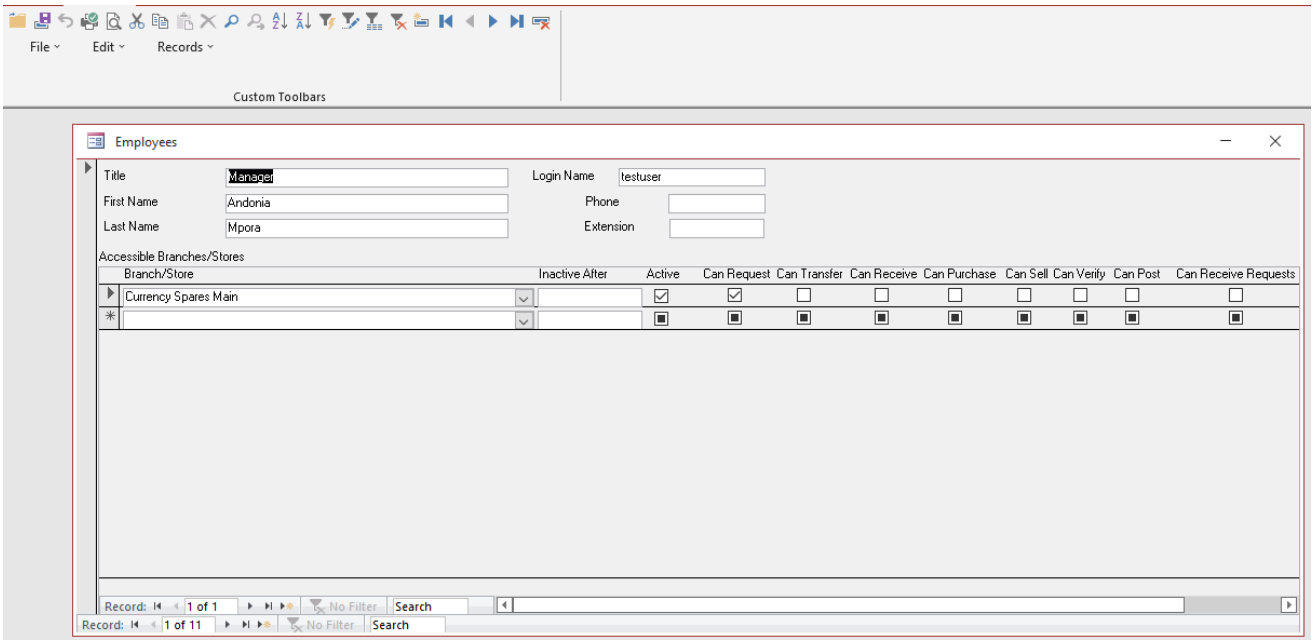

Figure 13: Adding an employee

3. Click the New Record button on the menu, to get a blank form to create a new employee

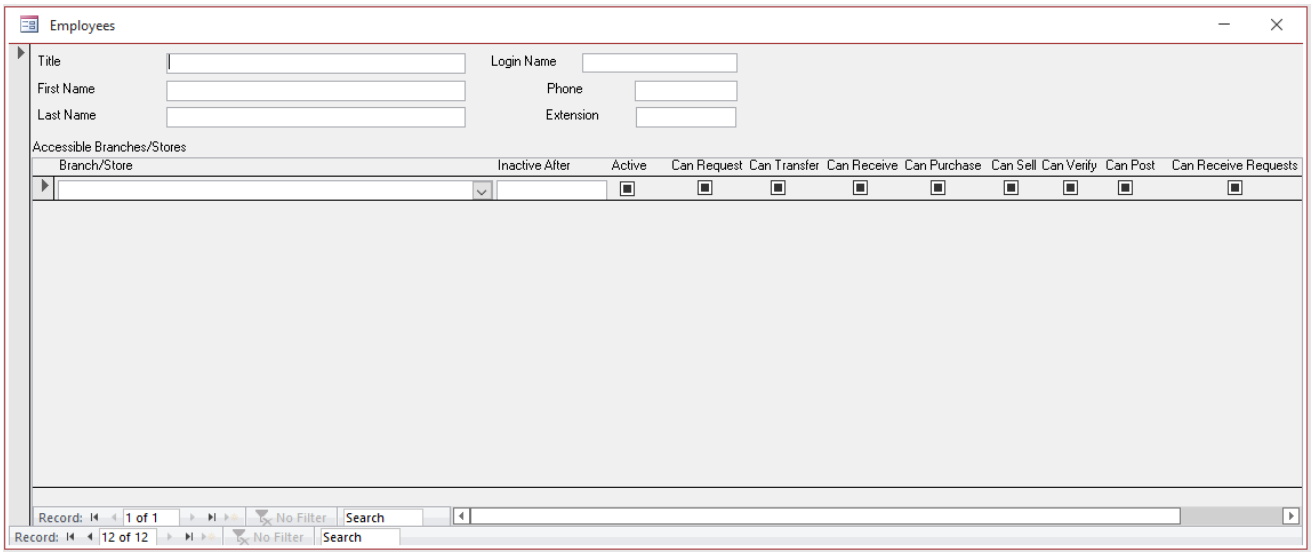

Figure 14: Employee form(Blank)

4. Enter the employee title, first name and last names
5. Enter the Login Name. This is the username for the account used to login
6. Optionally enter the phone and extension
7. Click the record selector to save employee

6.2 Modifying an employee

1. On the Main Switchboard click Enter/View Other Information
2. On the Forms Switchboard click Enter/View Employees
3. Using the navigation buttons to move from one employee record to the next until you reach the desired one
4. Make the required changes
5. Click the record selector to save

6.3 Accessible Branches/Stores

CSS allows you to assign employees to stores either through the Stores creation form or from the Employee form.

1. In the sub-form before the employee definition, select the store from the Branch/Store dropdown.
2. Optionally enter the Inactive After date. If entered, it means access expires immediately after the specified date.
3. Check the Active checkbox to activate the assignment
4. Check the other options to determine what operations the employee can do on this store. These include the following:
    a. Can Request: allows the user to make stock requests from this store
    b. Can Transfer: allows the user to transfer items from this store
    c. Can Receive: allows the user to receive items into this store.
    d. Can Purchase: allows the user to create purchase orders on this store
    e. Can Sell: allows the user to issue out items from this store
    f. Can Verify: allows the user to verify a transaction on this store
    g. Can Post: allows the user to post or confirm transactions on this store
    h. Can Receive Requests: allows the user to receive requested items into the store
5. Click the record selector to save. Note that moving to the next record automatically saves the previous one

7 Business Dates

The CSS uses business days for all its transaction creation functions. To create a business day, perform the following steps:

7.1 Adding a business date

1. On the Main Switchboard, click Enter/View Other Information
2. On the Forms Switchboard, click Maintain Business Days

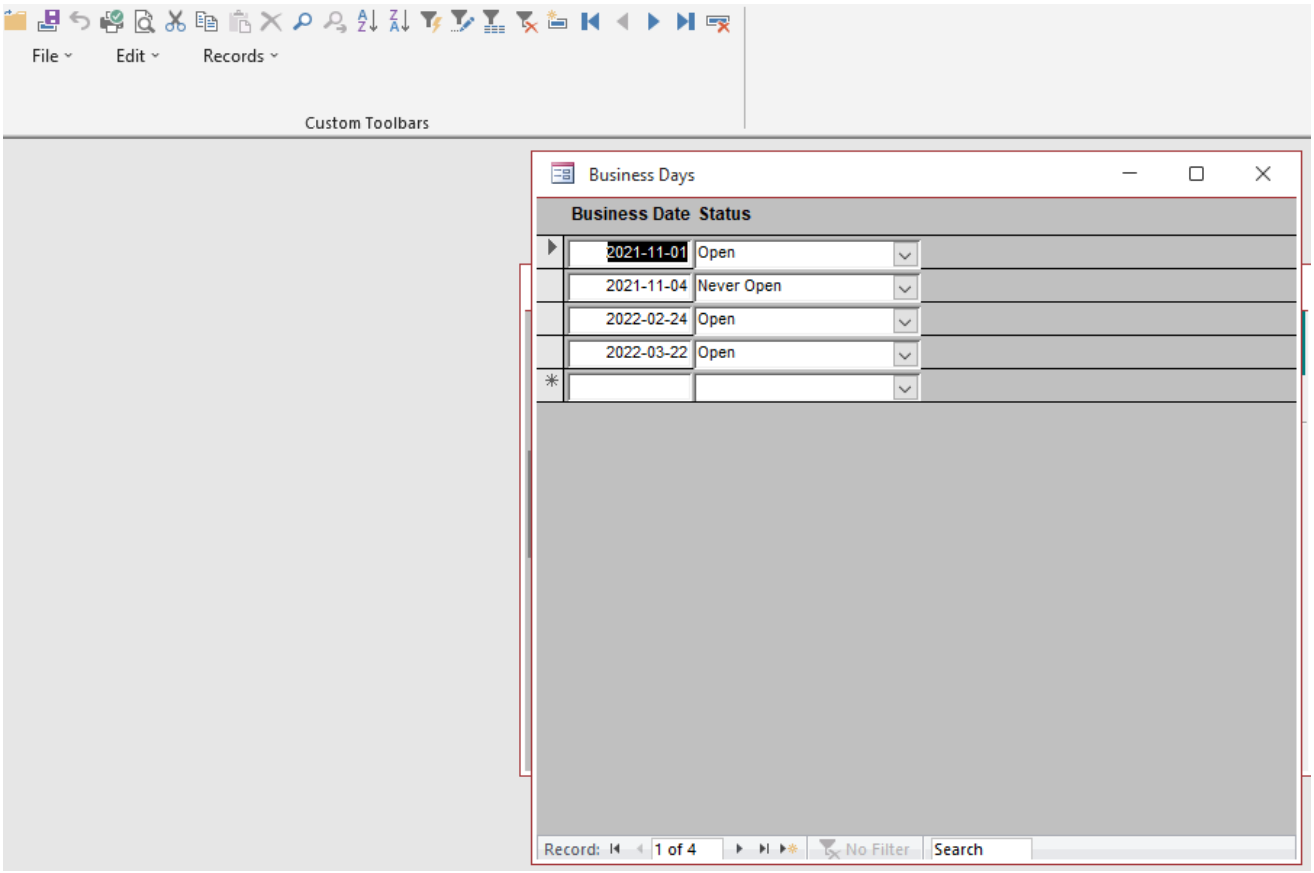

Figure 15: Business dates

3. On the Business Days form, move to the end of the rows
4. Enter the Business Date as shown in the illustration
5. Select a Status for the business date. The available statuses are: Never Open, Open, Closed. For a new business date, select Never Open

Note: Only business dates with Open status can be used in a transaction.

6. Click the record selector to save

7.2 Open/Close Business Day

1. Open the Business Days window
2. Find the business date to open or close
3. Change the Status to Open or Close respectively
4. Save the changes

8 Reports

The CSS has several reports that can be used by the user to make decisions about the stock.

1. On the Main Switchboard click Preview Reports
2. On the Reports form, select the required report by name
3. Click Preview Report to open the report in preview mode
4. Click Print Report to open the Print dialog box that will enable you to send the report to a printer
5. Click Report to File to export the report a file

9 Transactions

9.1 Receipts

The first transaction type in the CSS is a receipt. The receipt transaction increases the stock levels of a product in a give store. All other transactions can only be performed on a product if it is in stock. All new stocks in the CSS are received from the IFS.

9.1.1 Receipt Header

A receipt consists of a header and details. To create a receipt header the following steps can be performed:

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Receipts
3. Click New Record button (circled red in illustration below) to get a blank form.

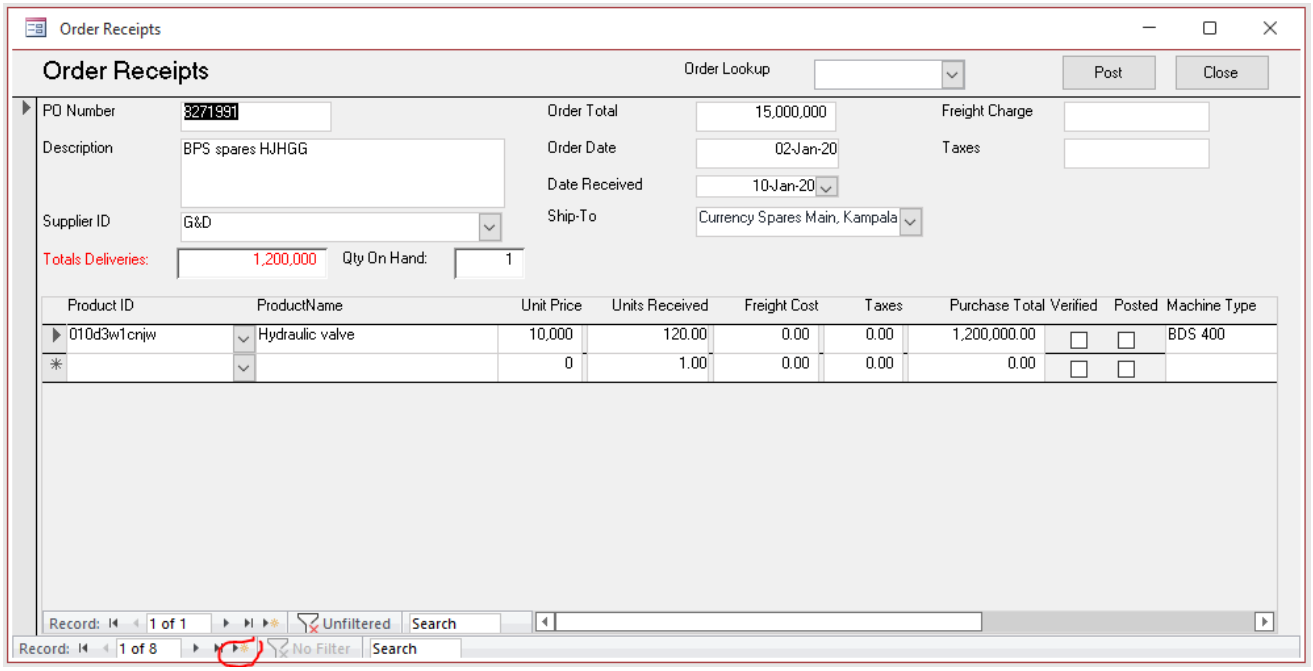

Figure 16:Receipts

4. On the Order Receipts form, enter the following information
    a. Enter the PO Number for the receipt. This will probably be provided from the IFS and must be unique to this order. It is a mandatory field that needs to be filled in.
    b. Enter a brief description for the order.
    c. Select the supplier from the Supplier ID dropdown list
    d. Optionally enter the Order Total and Order Date
    e. Select the Date Received from the dropdown list. This is a mandatory field. The dropdown list only displays open business dates
    f. Select the Ship-To store from the dropdown list
    g. Optionally enter the total Freight Charge and Taxes for this order

5. Click the record selector to save the order

9.1.2 Receipt Details

After creating and saving the header, you can then add the receipt details.

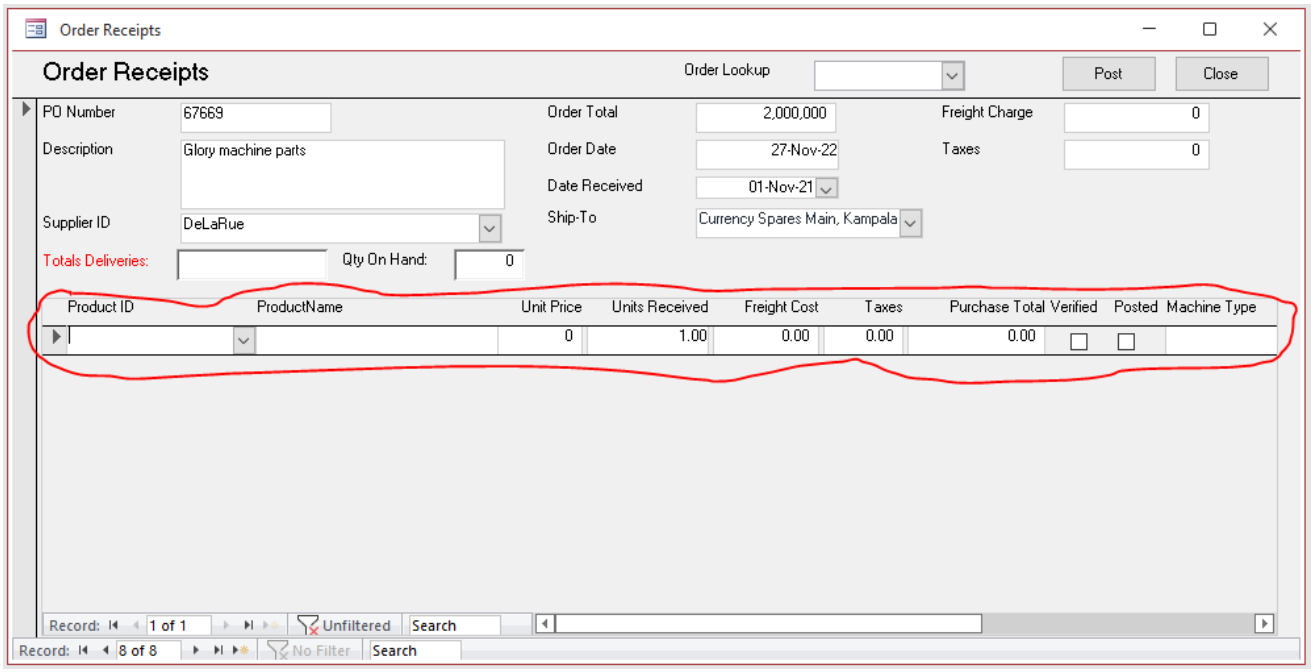

Figure 17: Blank Receipt

In the sub-form below the receipt header, add each receipt as follows:

1. Select the spare part to receive from the Product ID dropdown list. The Product Name and Unit Price will be automatically populated. For faster entry, it is recommended to use the Tab key to navigate from field to field

Note: The products listed are those that are supplied by the selected supplier in the Receipt Header.

2. Enter the Units Received.
3. Optionally enter the Freight Cost and Taxes charged for this part
4. Click the record selector to save. Alternatively move to the next row and the CSS will automatically save the previous row

Note: For each product selected, the CSS displays in the Qty On Hand field (circled red) the available quantity for the product in the selected store. For all deliveries, the CSS displays the total in the Total Deliveries field which can be reconciled with the value entered in the Order Total field

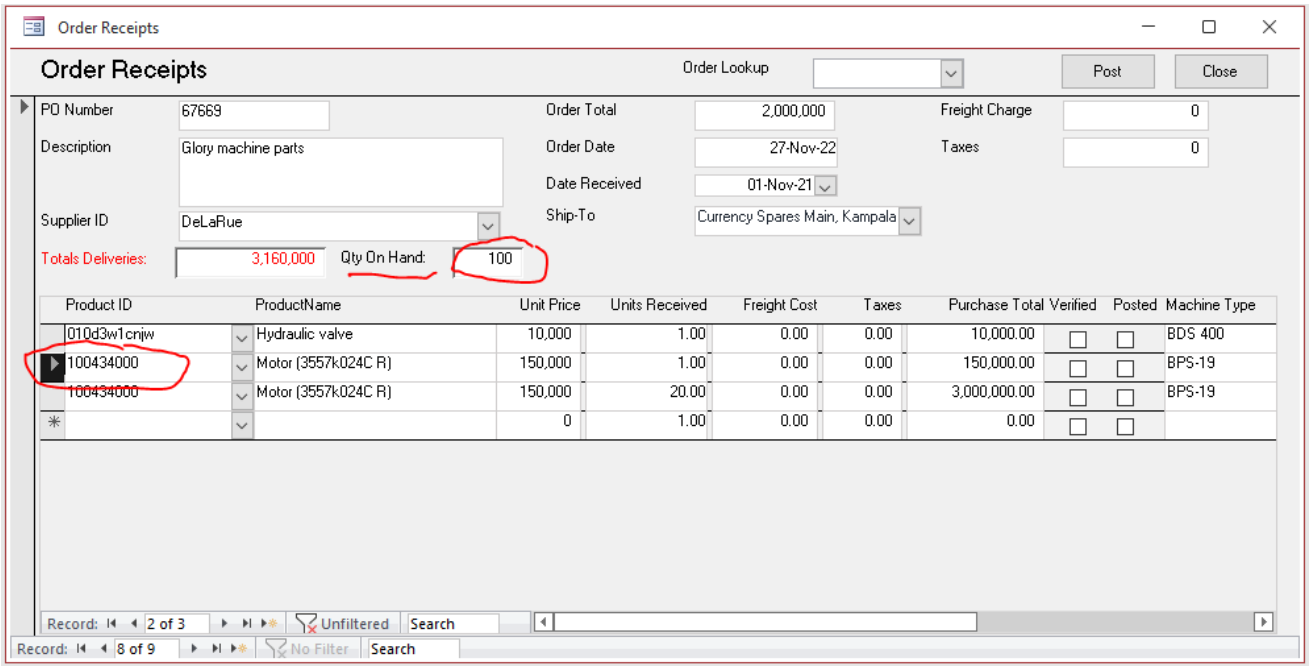

Figure 18: Examples of receipts

9.1.3 Verifying Receipts

All receipts must be verified by an authorized user before they can be posted. To be able to verify transaction, the user must have been setup as an employee with the permission **Can Verify** for the selected store. See section on Employee Maintenance for details.

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Receipts
3. Find the Receipt using the Order Lookup. Alternatively, you can use the navigation buttons to move to the required receipt.
4. In the receipt details region, find the line to verify.
5. Check the Verified box (circled in red in the illustration)
6. Save the record
7. Repeat for all other rows that are to be verified

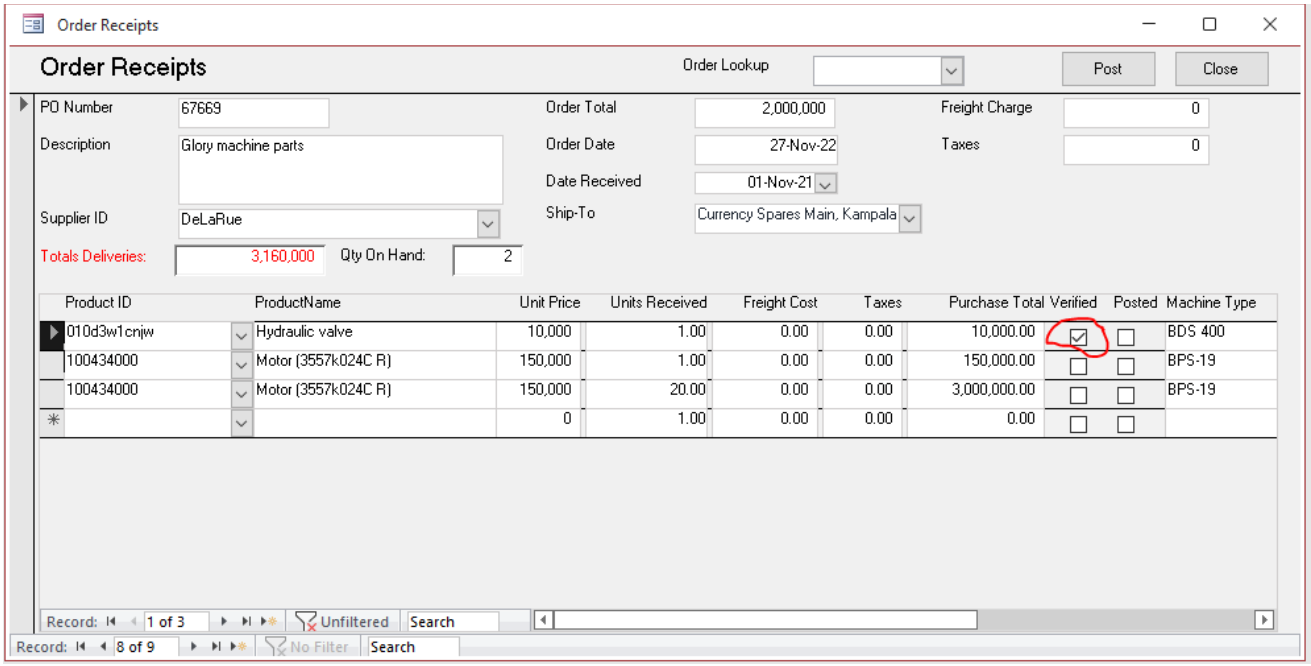

Figure 19: Verifying receipts

9.1.4 Posting Receipts

All receipts must be posted for the stocks to be increased. Transactions once posted cannot be modified. To be able to post transactions, the user must have **Can Post** permission for the selected store (see Employee Maintenance)

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Receipts
3. Find the Receipt using the Order Lookup. Alternatively, you can use the navigation buttons to move to the required receipt.
4. Click the Post button to post all verified receipts

9.2 Requests

The CSS has functionality to enable a user request for a spare part from another store. For example, spare parts are first received in the main store. Users from other branches may create requests on the main store to get the spare parts. After approval, the keeper of the main store may transfer the requested parts to the requesting store.

To be able to make a request, the user must have the Can Request permission on the specified store. The following steps can be performed to create a request.

1. On the Main Switchboard, click Inventory Transactions
2. On the Transactions Switchboard, click Enter/View Requests

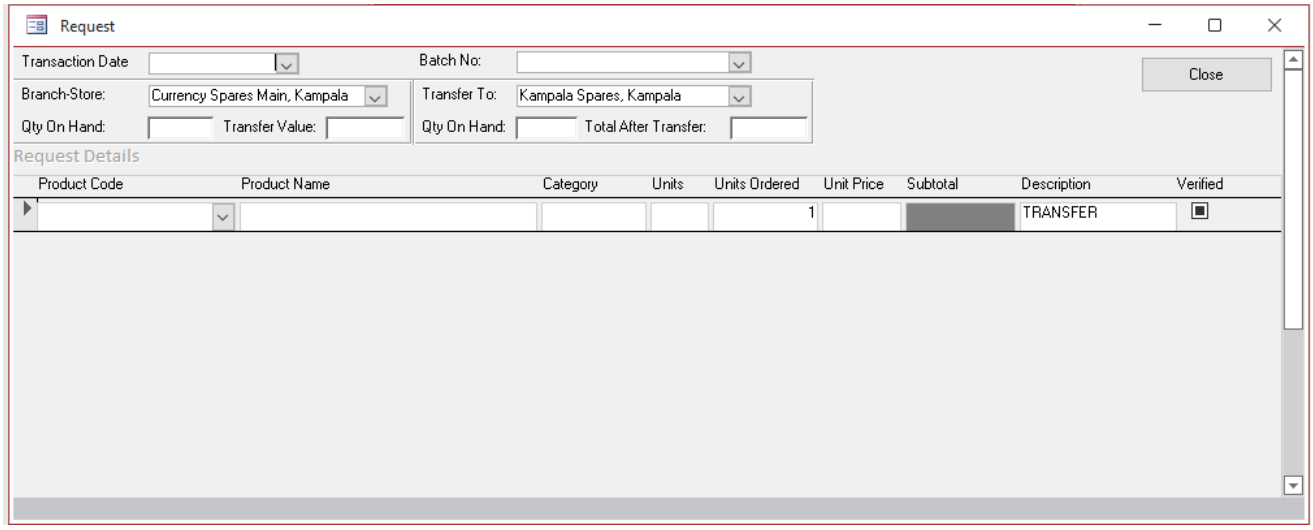

Figure 20:Requests

3. Select the date from the Transaction Date dropdown list. Only open business dates are displayed
4. If this is a new request batch, then enter a unique Batch No. The Batch No should follow an agreed format to be able to easily distinguish requests from various stores. An example could be: RQ-JJA-MAIN-02DEC22-1 meaning first request on 02-DEC-2022 from Jinja store to Main store. The decision on the format to use has been left to the users
5. If this is not a new request then the Batch No is selected from the dropdown list
6. Select the source store in the Branch/Store dropdown list.
7. Select the store which is requesting from the Transfer To dropdown
8. Move to the Request Details Region and enter the following:
    a. Select the spare part from the Product Code dropdown list
    b. Enter the Units Ordered
    c. Save the record
    d. Repeat (a) to (c) for all lines in the request
9. Close the form

9.2.1 Verify Requests

To verify a transaction, the user must have Can Verify permission on the store.

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Requests
3. Select the date from the Transaction Date dropdown list.
4. Select the Batch No.
5. Select the Branch/Store and the Transfer To stores
6. Check the Verified box
7. Save the record
8. Repeat for all other rows that are to be verified

9.3 Issuances

The Issues form is used to issue out spare parts for use. To issue out parts, the user must have Can Sell permission. The steps below can be followed to create batch of issues.

1. On the Main Switchboard, click Inventory Transactions
2. On the Transactions Switchboard, click Enter/View Issuances
3. Select the date from the Transaction Date dropdown.
4. Select the issuing store from the Branch dropdown list.
5. Select a request batchto issue out from the Batch No dropdown. The items in the request will be displayed in the Issue Details region.
6. Move to the Issue Details region and enter the lines of issues as follows:
    a. For each line, enter the Units Issued
    b. Save the record

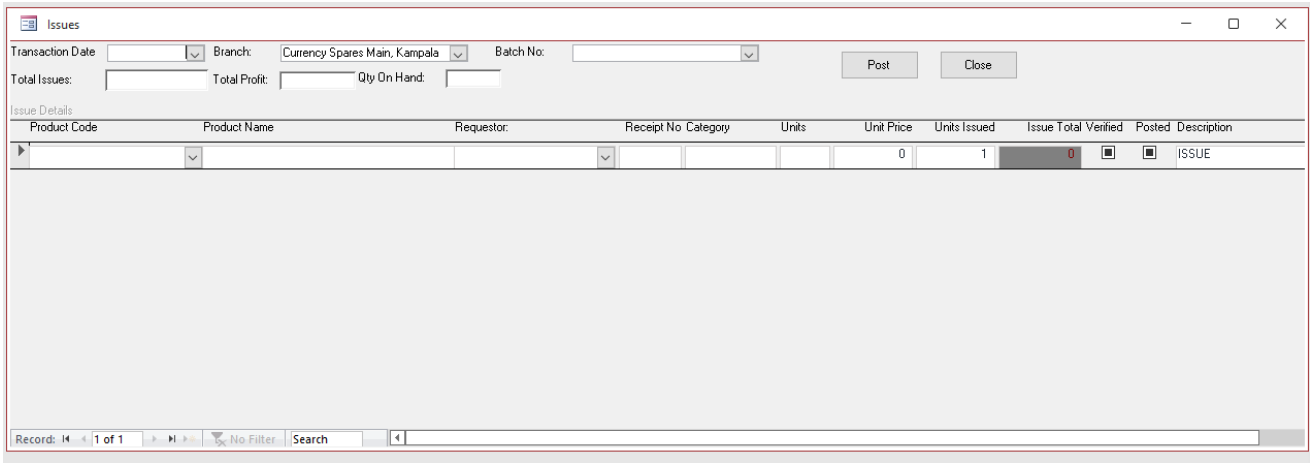

Figure 21:Issues

9.3.1 Verify Issues

To verify a transaction, the user must have Can Verify permission on the store.

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Issuances
3. Select the date from the Transaction Date dropdown list.
4. Select the Batch No.
5. Select the Branch/Store
6. In the Issue Details region, check the Verified box for the first row
7. Save the record
8. Repeat for all other rows that are to be verified

9.3.2 Post Issues

All issues must be posted for the stocks to be reduced. Transactions once posted cannot be modified. To be able to post transactions, the user must have **Can Post** permission for the selected store (see Employee Maintenance)

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Issuances
3. Select the date from the Transaction Date dropdown list.
4. Select the Batch No.
5. Select the Branch/Store. All the issues should be displayed in the Issue Details region.
6. Click the Post button to post all verified issues

Note: Only verified issues will be posted

9.4 Transfers

The CSS provides the Transfer form to move spare parts from one store to another store. To able to use this functionality the user needs Can Transfer permission.

The steps below can be used to create a batch of transfers.

1. On the Main Switchboard, click Inventory Transactions
2. On the Transactions Switchboard, click Enter/View Transfers
3. Select the date from the Transaction Date dropdown.
4. Select the issuing store from the Branch/Store dropdown list.
5. Select the destination store from the Transfer To dropdown list.
6. If this is a new batch, enter the Batch No, otherwise select from the Batch No dropdown.
7. Move to the Transfer Details region and enter the lines of issues as follows:
    a. Select the spare part to transfer from the Product Code dropdown list
    b. Enter the Units Transferred. Note that the units are multiplied by -1 on saving
    c. Optionally enter the Freight Cost and Taxes
    d. Save the record
    e. Repeat (a) to (d) for all transfers

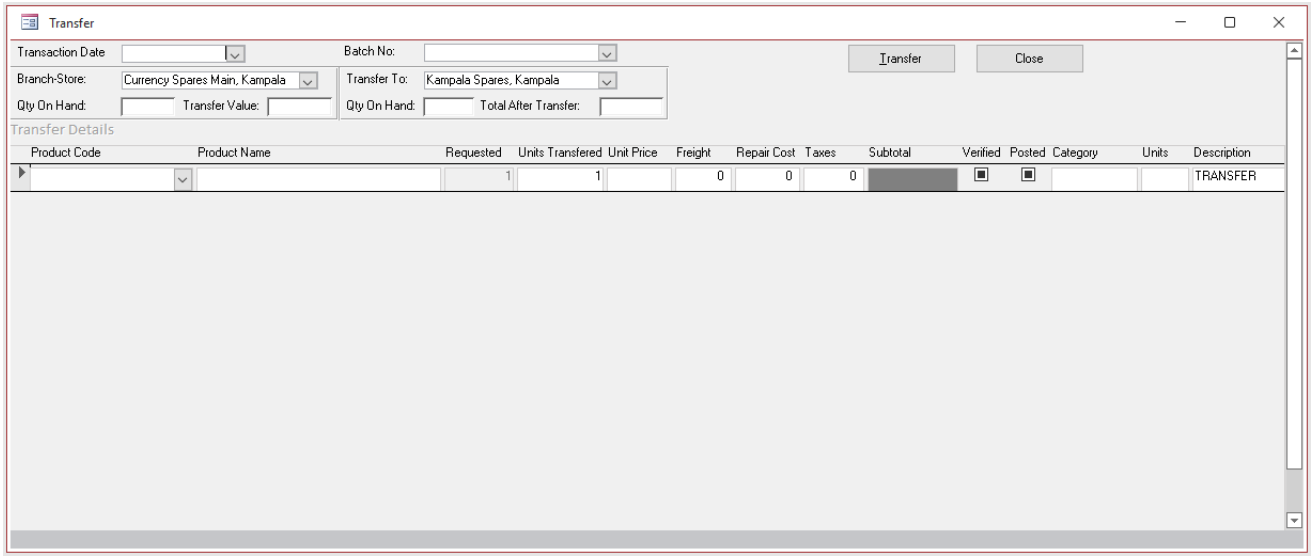

Figure 22:Transfers

9.4.1 Verifying Transfers

To verify a transaction, the user must have **Can Verify** permission on the store.

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Transfers
3. Select the date from the Transaction Date dropdown list.
4. Select the Batch No.
5. Select the source Branch/Store
6. Select the destination store from the Transfer To dropdown
7. In the Transfer Details region, check the Verified box for the first row
8. Save the record
9. Repeat for all other rows that are to be verified

9.4.2 Posting Transfers

To be able to post transactions, the user must have **Can Post** permission for the selected store (see Employee Maintenance)

1. On the Main Switchboard, click Inventory Transactions button
2. On the Transactions Switchboard click Enter/View Transfers
3. Select the date from the Transaction Date dropdown list.
4. Select the Batch No.
5. Select the source Branch/Store and the destination store.
6. Click the Transfer button to post all verified issues

10 Other Setups

10.1 Categories

On the Products form when a particular Machine/Type is not found in the dropdown list, a user can add a new category by click the Add button.

The Categories form enables the user to add or delete machines or any other category.

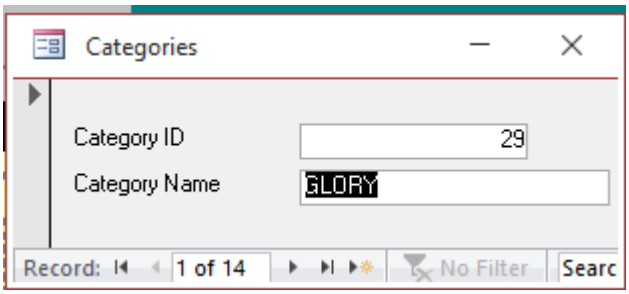

Figure 23:Categories

10.2 Suppliers

The Products form also provides for capturing the supplier for each product. If the required supplier does not exist, then the user can add another supplier by clicking Add

The Suppliers form illustrated below allows the user to add or delete suppliers. However, care must be taken not to delete the default supplier.

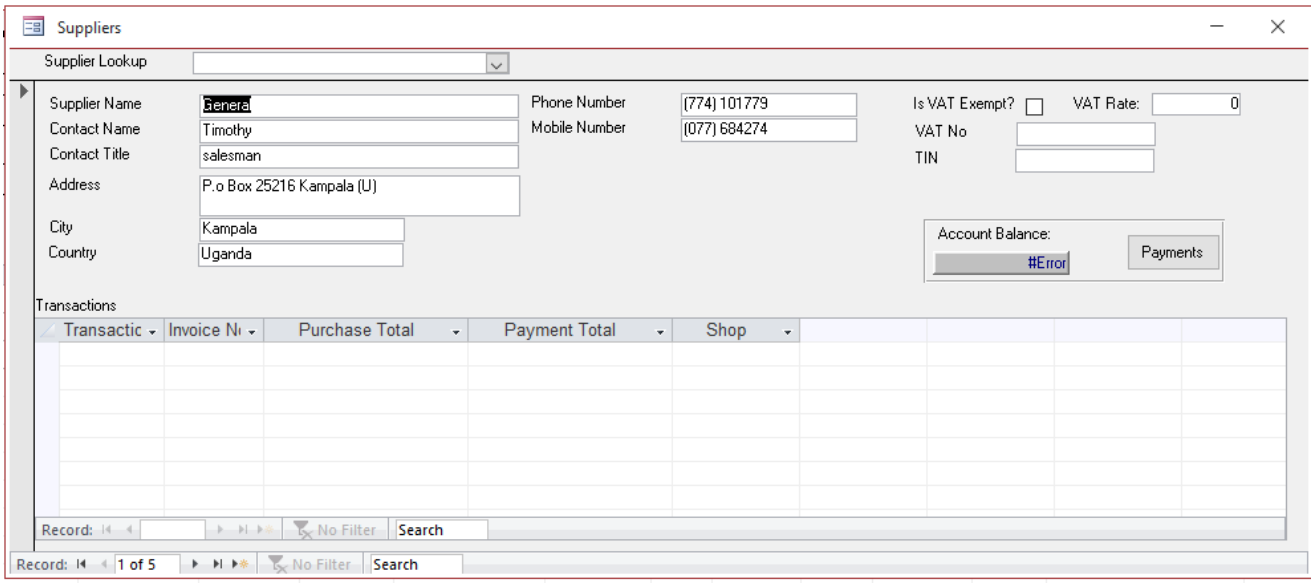

Figure 24:Suppliers
